#### PC-SOLVE III User's Manual

1996

this informative manual has been designed to provide guidance on the principal issues surrounding the use of timber in coastal and river engineering for centuries timber has traditionally been used for the construction of a wide range of coastal and river structures including groynes jetties lock gates navigation aids and riverbank protection it is an attractive choice of construction material because it is renewable is easy to use repair and recycle has a high strength weight ratio and is visually appealing

community oriented conservation of natural resources and promotion and protection of trees in drylands are examples to deal with climatic adversities this book provides knowledge on climatic ecological social and economic condition of dry areas and lay

out approaches and strategies to restore degraded lands there are 15 chapters and first five deals with physiography of rajasthan drylands ecology problems of land degradation its economic evaluation and the approaches and strategies of restoration and rehabilitation next two chapters describe the problems of sand drift salinity water logging and effluent inflicted areas and strategies to control them chapters 8 10 deal with seed production quality planting materials genetic improvement propagation and planting techniques chapters 11 12 describe methods of rain water harvesting and irrigation and resources conservation for seed sowing and favouring regeneration and successions effective management of pests diseases in nurseries and plantation growth and yield prediction equations and models and people s perception and participation in managing forest resources have been described in last 3 chapters purpose of this publication is to strengthen the forest functionaries and readers with wide ranging knowledge on land degradation desertification and eco biology of drylands and methods to restore and rehabilitate degrading forest lands to increase forest cover enhance resilience and people livelihoods and improve environmental conditions academician researchers forest managers non government organizations extension agents and environmentalists can use it in developing conserving and managing drylands ecosystems for its long lasting beneficial effects this book is also useful to policy makers in effective planning of restoring protecting and conserving dryland s ecological and socioeconomic services

this self contained book focuses on the safety assessment of existing structures subjected to multi hazard scenarios through advanced numerical methods whereas the focus is on concrete dams and nuclear containment structures the presented methodologies can also be applied to other large scale ones the authors explains how aging and shaking ultimately lead to cracking and how these complexities are compounded by their random nature nonlinear static and transient finite element analysis is hence integrated with both earthquake engineering and probabilistic methods to ultimately derive capacity or fragility curves through a rigorous safety assessment expanding its focus beyond design aspects or the state of the practice i e codes this book is composed of seven sections fundamentals theoretical coverage of solid mechnics plasticity fracture mechanics creep seismology dynamic analysis probability and statistics damage that can affect concrete structures such as cracking of concrete aar chloride ingress and rebar corrosion finite element formulation for both linear and nonlinear analysis including stress heat and fracture mechanics engineering models for soil fluid structure interaction uncertainty quantification probablilistic and random finite element analysis machine learning performance based earthquake engineering ground motion intensity measures seismic hazard analysis capacity fragility functions and damage indeces applications to dams through potential failure mode analyses risk informed decision making deterministic and probabilistic examples applications to nuclear structures through modeling issues aging management programs critical review of some analyses other applications and case studies massive rc structures and bridges detailed assessment of a nuclear containment structure evaluation for license renewal this book should inspire students professionals and most importantly regulators to rigorously apply the most up to date scientific methods in the safety assessment of large concrete structures

this volume brings together papers from geotechnical and civil engineers biologists ecologists and foresters they discuss current problems in slope stability research and

how to address them using ground bio and eco engineering techniques coverage presents studies by scientists and practitioners on slope instability erosion soil hydrology mountain ecology land use and restoration and how to mitigate these problems using vegetation
