groups of natural metabolite producers among the numerous genera streptomycetes have been recognized as prolific producers of useful natural compounds as they provide more than half of the naturally occurring antibiotics isolated to date and continue to emerge as the primary source of new bioactive compounds certainly these potentials have attracted ample research interest and a wide range of biological activities have been subsequently screened by researchers with the utilization of different in vitro and in vivo model of experiments literature evidence has shown that a significant number of interesting compounds produced by actinobacteria were exhibiting either strong anticancer or neuroprotective activity the further in depth studies have then established the modulation of apoptotic pathway was involved in those observed bioactivities these findings indirectly prove the biopharmaceutical potential possessed by actinobacteria and at the same time substantiate the importance of diverse pharmaceutical evaluations on actinobacteria in fact many novel compounds discovered from actinobacteria with strong potential in clinical applications have been developed into new drugs by pharmaceutical companies together with the advancement in science and technology it is predicted that there would be an expedition in discoveries of new bioactive compounds producing actinobacteria from various sources including soil and marine sources in light of these current needs and great interest in the scope of this research this book seeks to contribute on the investigation of different biological active compounds

there is a large market demand for new drugs the existing chronic or common ailments without cures development of new diseases with unknown causes and the widespread existence of antibiotic resistant pathogens have driven this field of research further by looking at all potential sources of natural products to date microbes have made a significant contribution to the health and well being of people globally the discoveries of useful metabolites produced by microbes have resulted in a significant proportion of pharmaceutical products in today s market therefore the investigation and identification of bioactive compound s producing microbes is always of great interest to researchers actinobacteria are one of the most important and efficient groups of natural metabolite producers among the numerous genera streptomyces have been recognized as prolific producers of useful natural compounds as they provide more than half of the naturally occurring antibiotics isolated to date and continue to emerge as the primary source of new bioactive compounds certainly these potentials have attracted ample research interest and a wide range of biological activities have been subsequently screened by researchers with the utilization of different in vitro and in vivo model of experiments literature evidence has shown that a significant number of interesting compounds produced by actinobacteria were exhibiting either

strong anticancer or neuroprotective activity the further in depth studies have then established the modulation of apoptotic pathway was involved in those observed bioactivities these findings indirectly prove the biopharmaceutical potential possessed by actinobacteria and at the same time substantiate the importance of diverse pharmaceutical evaluations on actinobacteria in fact many novel compounds discovered from actinobacteria with strong potential in clinical applications have been developed into new drugs by pharmaceutical companies together with the advancement in science and technology it is predicted that there would be an expedition in discoveries of new bioactive compounds producing actinobacteria from various sources including soil and marine sources in light of these current needs and great interest in the scope of this research this book seeks to contribute on the investigation of different biological active compounds producing actinobacteria which are exhibiting antimicrobial antioxidant neuroprotective anticancer activities and similar

biosensors are finding increasing applications in different areas over the last few years the areas where biosensors may be used effectively has increased dramatically this book like the previous four books on analyte receptor binding and dissociation kinetics by this author addresses the often neglected area the kinetics of binding and dissociation in solution to appropriate receptors immobilized on biosensor surfaces occurs under diffusional limitations on structured surfaces the receptors immobilized on the biosensor surface contribute to the degree of heterogeneity on the sensor chip surface the fractal analysis examples presented throughout the book provide a convenient means to make quantitative the degree of heterogeneity present on the sensor surface and relates it to the binding and dissociation rate coefficients the fractal dimension is a quantitative measure of the degree of heterogeneity present on the biosensor surface the book emphasizes medially oriented examples the detection of disease related analytes is also emphasized the intent being that if intractable and insidious diseases are detected earlier they will be controlled better eventually leading to a better prognosis chapter 3 is a new chapter that emphasizes enhancing the

relevant biosensor performance parameters such as sensitivity stability selectivity response time etc as usual as done in previous books by this author the last chapter provides an update of the economics involved in biosensors and the difficulties encounters in starting up a biosensor company modelling of binding and dissociation kinetics of analyte receptor reactions on biosensor surfaces provides physical insights into these reactions occurring on biosensor surfaces very few researchers even attempt to analyze the kinetics of these types of reactions fractal analysis used to model the binding and dissociation kinetics original and unique approach economic analysis provided in the last chapter helps balance the book besides providing much needed information not available in the open literature emphasis on improving biosensor performance parameters helps make biosensors better empahsis on medically related analytes helps in prognosis of diseases
